DIAGNOSTIC IMAGING REPORT

PATIENT	ELLISON, Margaret	**DOB / AGE / SEX**	05/17/1950 / 76 / Female
MRN	SB-6602178	**ACCESSION**	SBR-26-0928-2290
ORDERING PROVIDER	Alicia Moreno, MD, St. Brazos Emergency Department	**EXAM DATE**	09/28/2026 07:22 PM
INSURANCE	Pecan Health Plans, Pecan Senior Advantage (HMO)	**MEMBER ID**	PSA-3308-9145
REPORT STATUS	Final	**REPORTED**	09/28/2026 07:58 PM

EXAM:

CT HEAD WITHOUT CONTRAST

CLINICAL INDICATION:

Ground-level fall at home with head strike. On apixaban for atrial fibrillation. Evaluate for intracranial hemorrhage.

TECHNIQUE:

Axial CT images of the head were obtained without intravenous contrast. Coronal and sagittal reformats were reviewed. CTDIvol: 48 mGy. DLP: 812 mGy-cm.

COMPARISON:

None available.

FINDINGS:

Brain: No intracranial hemorrhage, mass effect, midline shift, or CT evidence of acute infarct. There is a 14 mm homogeneous, mildly hyperdense extra-axial lesion along the left frontal convexity with a broad dural base and no surrounding edema. Mild periventricular white matter hypoattenuation, consistent with chronic small vessel ischemic change. Age-appropriate volume loss.

Ventricles and cisterns: Ventricles are normal in size for age. Basal cisterns are patent.

Sinuses and mastoids: Mild mucosal thickening of the maxillary sinuses. Mastoid air cells are clear.

Calvarium and soft tissues: No calvarial fracture. Small left frontal scalp hematoma.

IMPRESSION:

1. No acute intracranial hemorrhage or calvarial fracture.
2. Small left frontal scalp hematoma.
3. 14 mm extra-axial lesion along the left frontal convexity, most consistent with a meningioma. Consider nonemergent MRI brain with and without contrast.
4. Mild chronic small vessel ischemic changes.
